941 seconds!!!!!!

```
· Crafting... (941s · ↑ 37.4k tokens · esc to interrupt)
```

This is not hype—Claude Code proved the future is already Here

This little screenshot for me represents a turning point in AI. I can't believe what we are witnessing

Claude Code just kept going... and going and going...

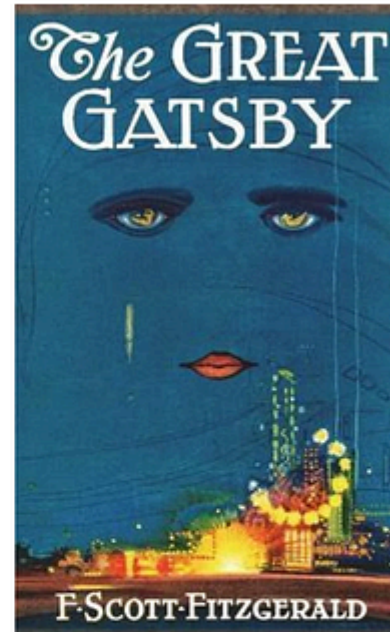

It took 941 seconds (which is 15 minutes) to complete!

It also did 37,400 tokens in one request. Let's put that into perspective:

```
· Crafting_ (941s · ↑ 37.4k tokens · esc to interrupt)
```

One Claude Code Prompt

28,000 Words

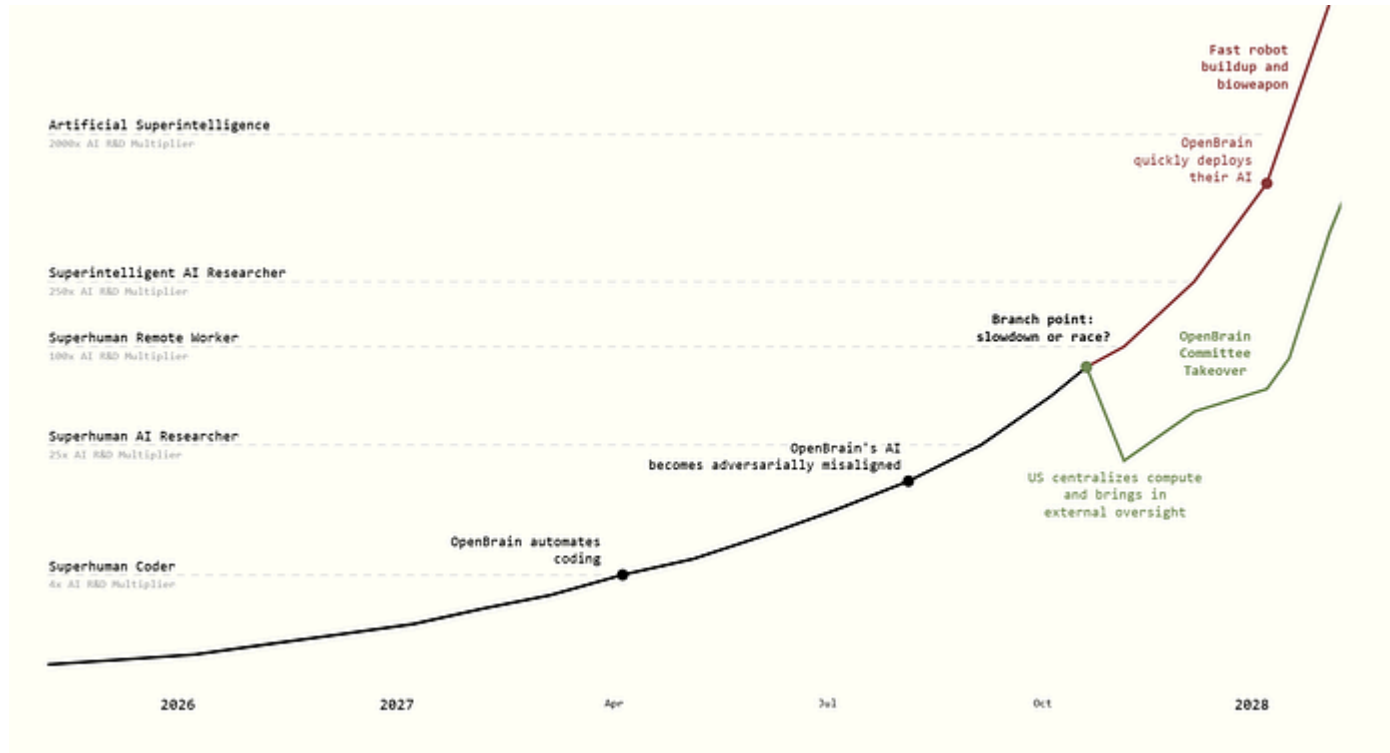

48,000 Words

That one prompt was half the length of the Great Gatsby

Not only did it take a long time, it one shotted my entire planning for a website, far better than I could have imagined.

Why is this a turning point?

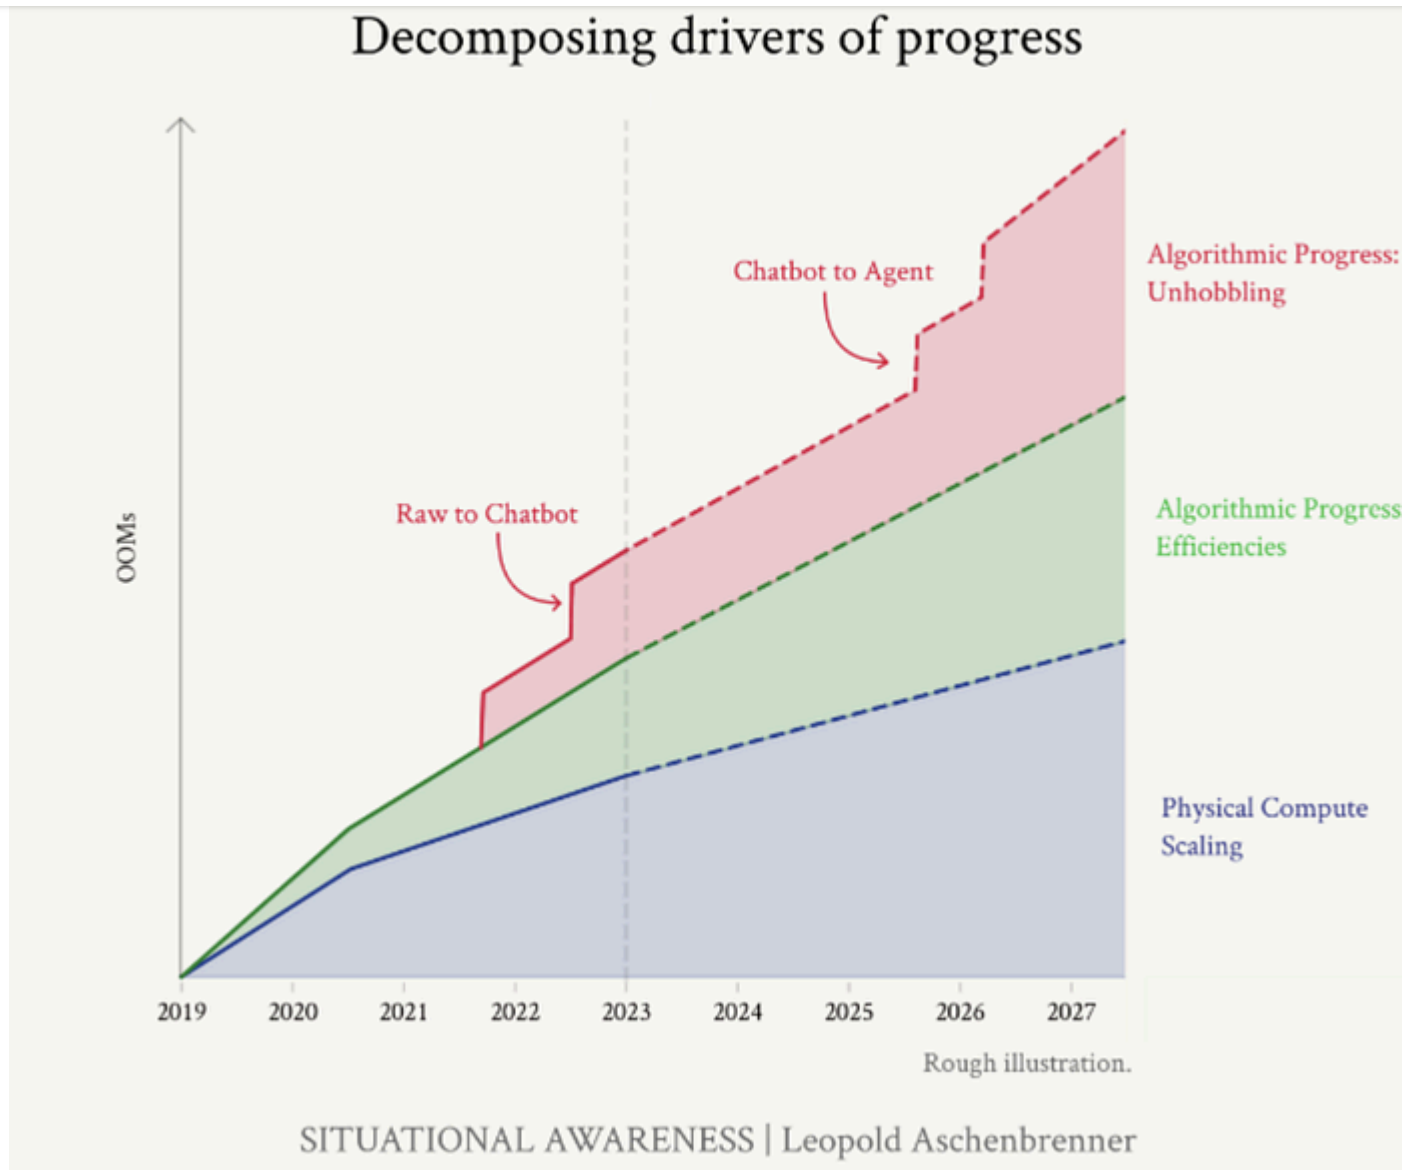

This graph is a forecast of the progress that we can expect [source](#)

The interesting thing to me about this prompt is that this website predicted that we would be here last year. It predicted that we would be having agents just go away and bubble on tasks and get them right.

This is also a good website: [source](#)

So why am I so impressed?

It's official, I am now at the stage where I can prompt Claude Code and just honestly let it bubble away and then I just come back and check on it.

The moment for me was that I just did one request and it understood exactly what I wanted. Not only that, it did a far better job than I could have ever imagined.

So what did I do?

I've been playing around with planning prompts for a long time. The problem with doing a typical MVP plan though is that you get a lot of:

- timeline estimates (redundant)
- random tech stack bloat (e.g it needs to be on NextJS blah blah blah)

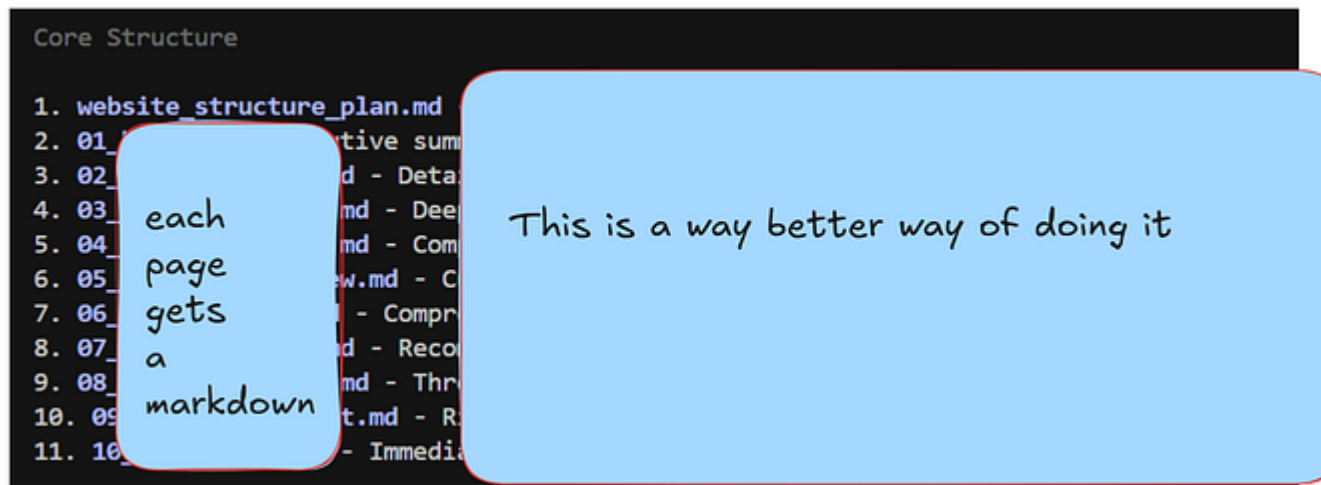

I have found that the output follows this strange pattern, it like compresses what I actually want and doesn't focus enough on depth.

So how did I change that?

- Create a plan for the whole website as a markdown file
- Then **ALSO** make a plan for each individual page on their own markdown files

That's how I got it to bubble away for 15 minutes.

Sorry I had to censor this as I used it for a real project and couldn't be bothered running another prompt for 15 minutes.

It creates a series of Markdown files

Then something crazier happened

A screenshot of a terminal window with a dark background. At the top left, there is a green dot followed by the text "Update Todos". Below this, a list of tasks is shown, each preceded by a checkbox. The first ten checkboxes are marked with an 'x', the eleventh is checked with a green 'x', and the last two are empty. A large, light blue rounded rectangle is overlaid on the right side of the terminal, containing the text "look how ridiculous this is" in a black, handwritten-style font. At the bottom of the terminal, there is a red asterisk followed by the text "* Pontificating..." and some statistics in parentheses: "(1207s · ↓ 33.0k tokens · esc to interrupt)".

<https://freedium.cfd/https://medium.com/realworld-ai-use-cases/this-is-not-hype-claude-code-proved-the-future-is-already-here-19f3174360b3>

That's 30 minutes, 2 requests and my entire project built.

```
* Pontificating... (1351s · ✖ 41.2k tokens · esc to interrupt)
```

This is absolutely insane. We are living in the future.

I want to recap how crazy this is, just so we are clear:

1. I fed this context of 15 markdown files initially.
2. It took all that information and managed to carve out the perfect plan for each individual page
3. It did the above in one request
4. It then implemented everything in one more request
5. I honestly didn't even prompt that well in either of my 2 prompts, I just wrote it in plain English.

It's not just the length, it's the quality that I can't get over. Like I didn't have to do anything to the finished product.

1. This website in particular was very backend light and only had a couple of basic CRUD screens.
2. This website was strategic and so the answers I was seeking was open ended.

But I don't think that takes away from the main point here.

Now it is at the stage where I can safely go cool here is my prompt, then go for a run and come back and trust that it will have finished what I want. HOW CRAZY IS THAT?

My blog is a snapshot of AI progress and I am calling it now, something has changed and this is a major milestone we have crossed.

So here is how you can do what I have done

1. **Break down a big task** — don't ask for "a whole app." Start with a planning prompt, then push deeper page by page.
2. **Use structured outputs** — ask for Markdown files, JSON, or tables so you can reuse the work easily.
3. **Chain your prompts** — first get the plan, then feed that plan back in for execution.

5. **Batch context** — give Claude Code the set of files or notes it needs up front, then let it run.
6. **Walk away** — treat it like an autonomous agent: set the request, leave it for 15 minutes, and come back to completed work.

Have you also experienced this?

Are there more tips that I could be doing better here? I can't be the only one that has experienced this breakthrough.

Let me know in the comments.
