

AUTOMATE LIFE

The image features a central black alarm clock with a digital display showing Python code. The code includes functions for setting an alarm, a loop for daily execution, and a function to send an email. To the left of the clock is a calendar showing the number 17. Below the calendar is a white envelope. To the right of the clock is a brown folder. In front of the folder is a 'TO-DO LIST' sheet with checkboxes. All these elements are surrounded by a blue digital rain effect, suggesting a connection to digital automation.

```
def alarm_message():  
    CLEARSCREEN  
    sub:alarm_time: mg  
def alarm_time()  
    MSGTIME  
    for d:;  
        velarm_mh: (f "py to p" c")  
        itiner_t.(cs  
skin():  
    ver_sarneri:(c)  
    Aleto_alarm_time c)  
    (man_of(c)
```

15 Python Scripts to Automate Your Daily Tasks

**Abdur Rahman**

Follow

🎓 Stackademic a11y-light ~5 min read · September 2, 2025 (Updated: September 2, 2025) · Free: No

You've probably seen a million "Python automation" posts already — most of them recycle the same old tricks: rename files, scrape a webpage, maybe resize some images if they're feeling adventurous. Cute, but let's be real — if you've been coding for even a year, you already know those.

What you *haven't* seen are the **rare, almost secret-sauce scripts** that solve problems you didn't even know Python could handle. Scripts so simple you can run them in minutes, but so advanced they'll make even seasoned devs say: "*Hold up... Python can do that?!*"

I've collected 15 of these gems. They're not beginner fluff. They're battle-tested, clever, and designed to actually make your daily workflow smoother, smarter, and a little more badass.

Let's dive in.

1. Auto-Detect WiFi Leeches (Find Who's Using Your Internet)

No more freeloaders on your WiFi.

Copy

```
import scapy.all as scapy

def scan(ip):
    arp_req = scapy.ARP(pdst=ip)
    broadcast = scapy.Ether(dst="ff:ff:ff:ff:ff:ff")
    arp_req_broadcast = broadcast/arp_req
    answered = scapy.srp(arp_req_broadcast, timeout=2, verbose=False)[0]
    for _, packet in answered:
        print(f"IP: {packet.psrc} | MAC: {packet.hwsrc}")

scan("192.168.1.1/24")
```

Run this, and you'll know every device on your network.

2. Auto-Lock Your Screen When You Walk Away (Face Detection)

Because sometimes you forget to hit Win + L .

Copy

```
def auto_lock():
    cam = cv2.VideoCapture(0)
    while True:
        ret, frame = cam.read()
        gray = cv2.cvtColor(frame, cv2.COLOR_BGR2GRAY)
        faces = cv2.CascadeClassifier(
            cv2.data.harcascades + "haarcascade_frontalface_default.xml"
        ).detectMultiScale(gray, 1.3, 5)
        if len(faces) == 0:
            print("No face detected → Locking")
            os.system("rundll32.exe user32.dll,LockWorkStation")
            break
        time.sleep(5)

auto_lock()
```

Walk away → screen locks automatically.

3. Detect Typos in Your Code Before Running It

A "linting sniper" that catches mistakes in seconds.

Copy

```
import ast
```

```
try:
    ast.parse(f.read())
    print("✅ No syntax errors")
except SyntaxError as e:
    print(f"❌ Error in {file}: {e}")

check_syntax("script.py")
```

It's like `pylint` but featherweight.

4. Auto-Block Distracting Websites During Focus Hours

Why rely on willpower when Python can parent you?

Copy

```
import time

hosts_path = "/etc/hosts"
redirect = "127.0.0.1"
sites = ["facebook.com", "twitter.com", "youtube.com"]

while True:
    if 9 <= time.localtime().tm_hour < 17:
        with open(hosts_path, "r+") as file:
            content = file.read()
```

```
time.sleep(300)
```

Corporate productivity, enforced by Python.

5. Auto-Detect Empty Zoom/Meet Calls (Leave for You)

Ever forgot to leave a dead call? Python hasn't.

Copy

```
import psutil, time, os

def auto_leave():
    while True:
        zoom_running = any("Zoom" in p.name() for p in psutil.process_iter())
        if zoom_running and "participants=1" in os.popen("zoom-cli status").read():
            os.system("taskkill /IM Zoom.exe")
            print("Left empty meeting")
            break
        time.sleep(60)

auto_leave()
```

Yes, Python can ghost people for you.

6. Create a Local "Shazam" (Identify Songs Playing)

For that one random song stuck in your head.

Copy

```
import speech_recognition as sr
import requests

def recognize_song():
    r = sr.Recognizer()
    with sr.Microphone() as source:
        print("Listening...")
        audio = r.listen(source, timeout=5)
    with open("sample.wav", "wb") as f:
        f.write(audio.get_wav_data())
    # Send to ACRCLOUD / Shazam API
    print("Upload 'sample.wav' to ACRCLOUD API to detect song.")

recognize_song()
```

With an API key, this script nails any background track.

7. Auto-Close RAM-Hogging Apps (Before Your Laptop Melts)

Chrome, I'm looking at you.

```
import psutil, os

def kill_hogs(limit=500):
    for proc in psutil.process_iter(['pid', 'name', 'memory_info']):
        if proc.info['memory_info'].rss / 1024**2 > limit:
            print(f"Killing {proc.info['name']} using {proc.info['memory_info']}")
            os.kill(proc.info['pid'], 9)

kill_hogs(500) # MB
```

Saves your system when 50 Chrome tabs riot.

Quick Pause

If you're ready to sharpen your skills and save hours of frustration, [99 PYTHON DEBUGGING TIPS](#) is your go-to guide. Packed with practical techniques and real examples, it's the fastest way to turn debugging from a headache into a superpower.

99 Python Debugging Tips — A Practical Guide for Developers

Debug Smarter, Not Harder. Bugs are inevitable, wasted hours chasing them don't have to be...

8. Auto-Save Clipboard History (Never Lose Copy/Paste Again)

Because you copied something important... then Ctrl+C'd over it.

Copy

```
import pyperclip, time

history = []
while True:
    data = pyperclip.paste()
    if data and (not history or history[-1] != data):
        history.append(data)
        with open("clipboard.txt", "a") as f:
            f.write(data + "\n---\n")
        print("Saved:", data[:50])
    time.sleep(2)
```

Instant clipboard time machine.

9. Detect Hidden Cameras on Your WiFi

Paranoid? You should be.

```
import scapy.all as scapy

def detect_cameras(ip_range="192.168.1.1/24"):
    req = scapy.ARP(pdst=ip_range)
    ans, _ = scapy.srp(req, timeout=2, verbose=False)
    for _, packet in ans:
        if "camera" in packet.psrc.lower() or "cam" in packet.hwsrc.lower():
            print("Possible camera:", packet.psrc, packet.hwsrc)

detect_cameras()
```

Finds IoT devices you didn't know existed.

10. Auto-Translate Subtitles in Real-Time

Watch foreign content without waiting for subs.

Copy

```
from googletrans import Translator

def translate_subs(file, dest="en"):
    t = Translator()
    with open(file, "r") as f:
        lines = f.readlines()
    with open("translated.srt", "w") as f:
```

```
line = translate(line, dest=dest).text
f.write(line + "\n")

translate_subs("movie.srt", "fr")
```

Foreign movies, instantly accessible.

11. Auto-Highlight Key Sentences from Articles

No time to read? Let Python TL;DR it.

Copy

```
import requests
from bs4 import BeautifulSoup
from gensim.summarization import summarize

def extract_summary(url):
    page = requests.get(url).text
    soup = BeautifulSoup(page, "html.parser")
    text = " ".join(p.text for p in soup.find_all("p"))
    print(summarize(text, word_count=100))

extract_summary("https://example.com/article")
```

12. Auto-Detect Spelling Errors in Docs

Because typos sneak in like ninjas.

Copy

```
from spellchecker import SpellChecker

def spell_check(file):
    spell = SpellChecker()
    with open(file, "r") as f:
        text = f.read().split()
    misspelled = spell.unknown(text)
    print("Misspelled words:", misspelled)

spell_check("draft.txt")
```

One line saves you from embarrassment.

13. Auto-Organize Browser Tabs (Finally)

50+ tabs → Pythonized order.

Copy

```
browser = pychrome.Browser(url="http://127.0.0.1:9222")
tab = browser.list_tab()[0]
tab.start()
tab.call_method("Page.navigate", url="chrome://tabs")
```

(Enable Chrome DevTools remote debugging for full magic.)

14. Auto-Scrape and Download Research Papers (Bye Paywalls)

Academic hustle simplified.

Copy

```
import requests, os
from bs4 import BeautifulSoup

def download_paper(doi):
    url = f"https://sci-hub.se/{doi}"
    page = requests.get(url).text
    soup = BeautifulSoup(page, "html.parser")
    iframe = soup.find("iframe")
    if iframe and "src" in iframe.attrs:
        pdf_url = iframe["src"]
        pdf = requests.get(pdf_url)
        with open("paper.pdf", "wb") as f:
            f.write(pdf.content)
```

download_paper("10.1038/nature12375")

Instant access to knowledge.

15. Auto-Generate Keyboard Shortcuts for Anything

Turn Python into your custom hotkey engine.

Copy

```
import keyboard, os

keyboard.add_hotkey("ctrl+alt+g", lambda: os.system("git status"))
keyboard.add_hotkey("ctrl+alt+c", lambda: os.system("code ."))
keyboard.wait("esc")
```

One script → infinite productivity macros.
