The Tech Bridge team's goal is to unlock synergies to many complex systems for corporate associates. The idea is unlock productivity and efficiency for users that historically have been neglected. We want to revamp the simple things such as new hire onboarding for our corporate office, ordering software and hardware that will take advantage of new technologies to improve processes from days to minutes.

We're looking for a creative and technically sharp Vibe Coder to push for an AI-first development team. In this role, you'll collaborate with AI tools to turn ideas into working software by crafting effective prompts, refining AI-generated code, and delivering engaging digital experiences. You'll work at the intersection of human creativity and machine intelligence, helping shape the future of software development.

As a Staff Software Engineer, you will set the tone of engineering-excellence and drive processes and standards within the team. You will lead the design of complex software changes and take on the development of exciting new features. In addition, you will partner with your senior and junior teammates throughout the software development lifecycle to cultivate a reciprocal learning environment from development to debuagaina and

This is the real deal.

More and more companies are seeing vibe coding as the real deal.

Of course many developers are still in denial.

HR usually has no idea what theyre doing on a day-to-day basis.

They hear some buzzword and slap it on an AI written job description because thats all their job requires.

Vibe coding is just gambling in disguise. Chat up an input, hope for the best on the output.

If it works 51% of the time, they call themselves a genius and make an ebook.

Because what vibe coding *really* means is that developers are finally being allowed to *focus*. No more spinning your wheels on boilerplate.

No more spending hours trying to scaffold out yet another UI flow that's 90% the same as last week's. No more pretending documentation is exciting.

AI does the boring stuff. You do the *real* work — thinking clearly, setting direction, maintaining the mission of the project.

The tools are here. Cursor. Windsurf. Claude Code. They let you shape a whole app without opening Stack Overflow once. You flow. You prompt. You build. You debug at the speed of thought.

And businesses are catching on. They're not just hiring developers who can memorize syntax and write boilerplate from scratch. They're hiring developers who can *design systems*, think fast, move faster — and *collaborate with AI* like it's second nature.

That vibe coder you're laughing at? They're now outputting 10x the features per sprint, spending half the time sipping coffee and planning product-market fit,

It's no longer "do you use AI when coding?" The question now is: *how well do you prompt?* How fluid is your interaction with a coding agent? Can you build and ship products faster than the average dev team — *on your own?*

We're talking developers who can:

- Build an MVP in a weekend using only natural language + refactors
- Design UIs visually and prompt the backend logic to match
- Jump between different stacks without having to "learn" them from scratch

They don't memorize. They *orchestrate*. That's the new skill set.

And vibe coding doesn't kill the developer. It *amplifies* the real ones. The strategic thinkers. The system architects. The fast learners. The ones who know how to move ideas into product — not just line-by-line into code.

So yeah. If you're laughing now you'll probably be crying later.

The wave is already here. Some devs are riding it.

Good luck with that.

We're building the future, with our minds. One prompt at a time.
