5 amazing MCP servers to make the most of GPT-5

GPT-5 is out now and AI agents are smarter than ever—but real power comes when you connect them to real-world tools.

That's where the **Model Context Protocol (MCP)** comes in. It lets GPT-5 talk to external services like your databases and repos — not just to understand them, but to *use* them.

Whether you're building your own agent or using GPT-5 through tools like Claude, Cursor, or Copilot, these 5 ready-to-use MCP servers instantly upgrade your AI's capabilities.

1. Firebase MCP server

If you're already using Firebase, this server lets GPT-5 interact with your project just like you would from the CLI. It's perfect for app automation, debugging, and user management — all from natural language.

Key features

- Instantly bootstrap Firebase projects and apps

-
- Query Firestore and validate security rules
 - Send push notifications via FCM
 - Supports Data Connect (GraphQL), Remote Config, and Crashlytics

Powerful use cases

- GPT-5 can spin up a full Firebase app with Firestore, Auth, and hosting
- Automatically summarize recent Auth activity and flag risky behavior
- Simulate rule access and debug failed reads/writes
- Analyze crash logs and propose fixes directly from Crashlytics data

2. GitHub MCP Server

This official GitHub server is built to give agents full visibility into your repos. It's great for AI-assisted issue triage, PR generation, and CI/CD diagnostics.

Key features

-
- ~~Granular control. Enable only repos, issues, pull requests, etc.~~
 - Read-only toggle for safe use
 - Supports Dependabot, CodeQL, GitHub Actions workflows
 - Plays well with Claude, Cursor, and other tools

Powerful use cases

- GPT-5 can scan issues across multiple repos and suggest the highest-impact fixes
- Generate summaries of PR conversations and flag unresolved feedback
- Automatically file issues for flaky tests or broken workflows
- Navigate GitHub Actions runs to debug CI/CD failures

3. Notion MCP

This hosted server lets GPT-5 act on your Notion workspace — fetching, editing, creating, and organizing content across pages and databases.

Key features

- One-click OAuth setup for ChatGPT, Claude, Cursor, etc.
- Unified search across Notion, Slack, Google Drive, and Jira
- Page and database read/write support
- Supports Streamable HTTP or stdio (via `mcp-remote`)
- Great for knowledge management and workflows

Powerful use cases

- GPT-5 can summarize meeting notes, create task trackers, or plan product launches
- Automatically organize messy pages into structured databases
- Generate content drafts based on workspace context
- Answer questions using data from across Notion, Slack, and Google Docs

4. DevDb MCP

Key features

- MCP server built into DevDb VS Code extension — also works for Cursor and Windsurf
- Auto-detects common frameworks like Laravel, Django, and Rails
- Supports Postgres, MySQL, SQLite, and SQL Server
- One-click JSON config for agent setup
- GUI tools for table editing and inspection

Powerful use cases

- GPT-5 can inspect schema and generate queries from natural language
- Document relationships and suggest schema changes
- Auto-generate database migrations or seed data
- Explore foreign key chains and infer business logic

5. Sentry MCP

This server connects GPT-5 to real-time error and performance data from Sentry — and lets it go beyond monitoring into automated debugging and even code generation.

Key features

- OAuth setup with hosted Streamable HTTP or SSE fallback
- Explore issues, events, traces, and performance regressions
- View project/org metadata and DSNs
- Integrated Seer tool for root-cause analysis and autofix
- Supports local self-hosted Sentry too

Powerful use cases

- GPT-5 can analyze top crashes, trace them to root causes, and suggest fixes
- Automatically file detailed bug reports linked to Sentry errors
- Monitor app performance and alert when KPIs regress

GPT-5 is out in the wild now and these MCP servers take its raw intelligence and plug it into real-world workflows.

From spinning up Firebase apps to analyzing crashes in Sentry or navigating your entire Notion workspace — this is the future of AI: not just being intelligent, but now making things happen at massive scale in the real world.

MCP Server Cheatsheet

Supercharge your AI workflow with this powerful MCP Server Cheatsheet — 30+ MCP servers containing several dozens of tools, curated across memory, accuracy, cloud, and data, and much more to help you develop astronomically smarter and faster.
