Imagine plugging your AI agent into the real world — like literally handing it a phone, a design app, a browser, or even a music studio — and saying, "Go create."

That's exactly what **Modular Command Protocol (MCP)** is making possible.

Think of MCP as the **USB-C of AI agents** — a universal interface that lets tools, APIs, and apps talk to your AI model in a clean, consistent way. No more messy glue code or integration nightmares.

And developers? We're using it to turn our wildest automation dreams into reality.

1. WhatsApp MCP — Chat Like a Human, But Smarter

AI agents can now send and receive WhatsApp messages, including **images, voice notes, and videos** — and if you add ElevenLabs MCP, it even speaks in your favorite voice. Imagine a voice bot handling your leads or doing customer support.

 @LukeHarries_

I built an MCP server for WhatsApp

It connects to your **personal** WhatsApp account

You can search your messages, contacts and send messages

It's fully open-source, self-hosted, and doesn't rely on third-party APIs

 Github 3.3k ★ : [Check out WhatsApp MCP](#)

2. Agentic RAG with Web Search (In Your IDE!)

This custom MCP server built for Cursor brings **deep search + Retrieval-Augmented Generation (RAG)** right into your development workflow. Search the web, read docs, and summarize — all without leaving your IDE.

3. Ableton MCP — Make Music with Prompts

Yes, music. Describe your vibe, and watch your AI agent generate a track in **Ableton Live** via MCP. It's like having a mini Daft Punk inside your terminal.

 *Github 1.3k* ★ : [Try Ableton MCP](#)

4. Figma MCP — Design Without Touching the Mouse

Tell your AI agent what to design and it collaborates with Figma directly. From wireframes to final UI screens — all created via text. It's like giving your cursor design superpowers.

@sonnylazuardi

omg cant believe this is possible.

inspired by this tweet, just tried to create a "Cursor talk to Figma MCP", allowing @cursor_ai to talk directly to @figma.

For example, I ask to design a modern looking login mobil screen.

screenshot from twitter

5. GroundX MCP — Make Any Document "Think"

This one's brilliant. Feed real-world documents — PDFs, diagrams, even scanned flowcharts — into the GroundX MCP server, and let your AI agent **analyze and answer questions** inside your IDE.

6. ElevenLabs MCP — The Voice of Your AI Agent

Let your AI **speak**, transcribe, or even make calls using ElevenLabs' hyper-realistic voices. One developer used it to spin up a bot that *ordered pizza*. No joke.

[Github 539](#) ★ : [Voice agent demo](#)

7. Effortless Web Scraping with Firecrawl MCP

The [Firecrawl](#) MCP server can crawl sites, extract data, and run deep research — all triggered by a single prompt. Perfect for market research, SEO audits, or even competitive intel.

[🔗 Github 2.5k ★](#) : *See Firecrawl in action*

8. Supabase MCP — Real-Time DB Access for Agents

Write to a database, create tables, read user data — all through your AI agent with Supabase MCP. No complex auth or backend setups needed.

Github 1.2k ★ : <https://github.com/supabase-community/supabase-mcp>

9. Browserbase MCP — Agents That Browse Like Humans

Use headless browsers to **simulate real user actions** — book hotels, fill out forms, scroll websites. The agent becomes your personal assistant on the web.

[Github](#) 840 ★ : [Explore Browserbase](#)

10. FastAPI MCP — Auto-Wrap Your APIs

This open-source gem turns any FastAPI app into a set of plug-and-play MCP tools — zero config required. Ideal for building custom toolchains for Claude, Cursor, or your own AI stack.

11 . Github Official MCP Server

GitHub's new MCP Server is a game-changing backend for developers building custom tools on top of GitHub. It simplifies authentication, event handling, and API interactions — all in a dead-simple Docker setup. Whether you're automating workflows, building dev dashboards, or creating AI-powered assistants, MCP provides real-time access to GitHub data with structure and scale. It's GitHub's

Github 11.3k 🌟 : <https://github.com/github/github-mcp-server>

Final Thoughts

MCP isn't just a cool protocol — it's the glue that's stitching together the future of AI tooling. As agents get smarter, they need smarter ways to **interact with our apps, APIs, and workflows**. MCP does exactly that.

If you're building AI tools, experimenting with agents, or just dreaming of automating everything — **now's the time to plug in.**

💬 Which MCP example blew your mind? Drop your favorite in the comments, and if you've built one — I *need* to see it!

Editor's note: Everything here is based on my own research and experience. I'm not affiliated with any of these projects — just sharing what I find genuinely useful.
